

General Guidelines

- ▶ This document is prepared for guiding your project assignment in the **IST4130** class.
- ▶ The grade you receive on this project will constitute **12%** of your overall lecture grade.
- ▶ The project report and documentation should be written entirely in **English**.
- ▶ **Generative AI Policy:** You can use the support of any LLM or generative AI models to get info about the subject, to research, to create the design, and to deploy your webpage on GitHub. However, you must be fully comfortable with every line of code and every output on your webpage. You will be tested on your understanding of these components during your presentation.

Project Objective and Format

Project Objective: In this project, your group will design a website for a business of your choice (restaurant, florist, bakery, gym, etc.). Instead of completing the project all at once, you will demonstrate the evolution of your page by gradually integrating the technologies we have learned throughout the semester.

Project Format: Your project folder will contain different folders or HTML files, and all these stages will be accessible via a single "Landing Page".

Project Development Stages: Stage 1

Stage 1: Project Landing Page

- ▶ This page serves as the "showcase" of your project and is the main entry page introducing it.
- ▶ It must include your **group members' names and student IDs**, the type of business you chose, and clear, understandable links (`<a href="...">`) directing to each stage of the project (Stage 2, 3, 4, etc.).

Project Development Stages: Stage 2

Stage 2: Skeleton (HTML Only)

- ▶ This is the homepage of your chosen business created using only HTML tags. No CSS files should be linked.
- ▶ **Mandatory Usage:** The page content must include at least one **table** (e.g., working hours or product prices) and at least one **image**.
- ▶ *Note:* The use of semantic HTML5 tags is not mandatory, but students may include these tags in their projects if they wish.

Project Development Stages: Stage 3

Stage 3: Colors and Typography (CSS Excluding Box Model)

- ▶ In this version, created by copying the HTML from Stage 2, CSS codes will start to be included.
- ▶ **Mandatory Usage:** At least one font selected via **Google Fonts** and appropriate icons from **FontAwesome** or similar **icon libraries** must be added to the design.
- ▶ **Important Rule:** The `margin` and `padding` properties must *strictly* not be used in this stage. You are expected to observe how cramped the content appears.

Project Development Stages: Stage 4

Stage 4: Spacious Design (Box Model Integration)

- ▶ Box Model rules will be applied on top of the design from Stage 3.
- ▶ By assigning appropriate margin, padding, and, when necessary, border values to all elements, the page should achieve a professional and spacious appearance.

Project Development Stages: Stage 5

Stage 5: Modern Layout (CSS Grid Only)

- ▶ The overall page layout must be created using **CSS Grid**. The content should be placed into a proper grid structure.
- ▶ *Note:* The use of Flexbox is not mandatory. However, students are free to use Flexbox for specific alignments, such as navigation bars.

Project Development Stages: Stage 6

Stage 6: Interaction and Dynamism (JavaScript & DOM)

- ▶ Interactive features will be added to your page using JavaScript.
- ▶ **Mandatory Usage (Product Selection via DOM):** There must be a product/service selection interaction on the page. When a user clicks on a product, a dynamic update must occur via DOM manipulation to display the user's selection on the screen (e.g., adding an item to a shopping cart and updating the total price).
- ▶ Apart from this mandatory interaction, you are completely free in your use of JavaScript. You can develop additional features depending on your project's structure.

Project Development Stages: Stage 7

Stage 7: Deployment (GitHub Pages)

- ▶ The final version containing all stages of your project will be uploaded to GitHub, and your project will go live on the internet by enabling the GitHub Pages feature.
- ▶ Example webpages:
 - ▶ **Restaurant**
 - ▶ **Flower Shop**

Submission Logistics

Submission Logistics

- ▶ The project will be announced on the university's online system (online.yildiz.edu.tr), but it will only be visible to **group representatives**.
- ▶ Group representatives are responsible for submitting all the materials used for creating the webpage (HTML, CSS, JS files, all images) in a compressed .rar or .zip file to the online system, along with the live link to the GitHub Pages.
- ▶ **Deadline for Submission: June 7th, 2026, Sunday at 23:59.**

Presentation Details

- ▶ You need to make a presentation on your project on **Week 16 - June 10th, 2026, Wednesday** during the lecture hour.
- ▶ The expected presentation duration is **15 minutes** for each group.
- ▶ Presentations can be made in **English** or **Turkish**.
- ▶ **Attendance Requirement:** Every member of the group should be present at the class during the presentation. Students who do not attend the presentation will **fail** the project regardless of their contribution.
- ▶ **Proof of Project:** Students must bring a printed copy of the final version of their webpage. This printed copy must be delivered to the lecturer on presentation day (Week 16 - June 10th, 2026, Wednesday) in exchange for a signature.

Recommended Resources for Design Inspiration

To bridge the gap between raw code and a polished final product, explore these resources for layout, typography, and color inspiration:

- ▶ **Dribbble & Behance:** Search for specific UI components (e.g., "florist landing page", "pricing table") and observe spacing and layouts.
- ▶ **Land-book:** Curated gallery of the best landing pages on the web, highly relevant for Stage 1.
- ▶ **CodePen:** A front-end development environment to search for concepts like "CSS Grid layout" to see live HTML, CSS, and JS.
- ▶ **Unsplash & Pexels:** Great sources for high-quality, royalty-free images.
- ▶ **Coolers:** Generate cohesive and professional color palettes for your website.

Evaluation Criteria (Rubric)

Evaluation Criteria	Points	Description
HTML Structure and Basic Elements	15	Completeness of Stages 1 and 2. Correct use of tables and images.
CSS, Typography, and Box Model	20	Use of Google Fonts and FontAwesome (or similar icons). Clear application of the margin/padding differences.
CSS Grid Layout	25	Successful implementation of Grid layout in Stage 5 without breaking the page.
JavaScript and DOM Interaction	25	Flawless execution of the product selection event and dynamic DOM updates.
GitHub Pages and Presentation	15	No broken links; successful live deployment process.
Q&A Performance	Deduction	Based on your answers to the questions during the presentation, there might be a deduction on your points.
